# FLASH – the Free-Electron Laser at DESY – today

DESY (Hamburg, Germany) is one of the world's leading centers for research on and with particle accelerators

- FLASH is based on TTF FEL
  - First lasing February 2000
- FLASH is an FEL User Facility since 2005
  - Driven by a **superconducting accelerator** using TESLA technology
  - Maximum electron beam energy 1.35 GeV
  - Provides several thousand photon pulses per second
  - **Two undulator beamlines** operated in parallel
    - FLASH1: **externally seeded**
    - FLASH2: **SASE**
  - Photon wavelength range from **XUV to soft X-rays** (85 nm to 3 nm)
  - Integrated electron beam driven **THz** source (1-30 THz)
  - Third electron beamline (FLASH3) hosts a PWFA experiment

TTF = TESLA Test Facility  
 TESLA = TeV Energy Superconducting  
 Linear Accelerator

SASE = Self-Amplified Spontaneous Emission  
 Externally seeded = an external coherent light pulse  
 initiates the lasing process  
 PWFA = Plasma WakeField Acceleration

VUV = Vacuum ultraviolet: 10 nm – 200 nm  
 EUV/XUV = Extreme ultraviolet: 10 nm – 100 nm  
 Soft x-rays < 10 nm

# The FLASH story began already in 1990's

Lively discussions about the future accelerators for high energy physics and x-ray photon science

- Photon science community: synchrotron light sources already in operation, an **X-ray Laser** was still only **a dream**
- Particle physics community: a vision to build a TeV-scale **linear electron-positron collider**
- Accelerator community: several design proposals for the linear collider
  - Most experts had an opinion that the linear accelerator should be a **normal conducting copper linac**
  - Alternative possibility of **superconducting linac** started to be seriously considered
    - Superconducting linacs were already discussed and proposed in 1960's
- Bjørn H. Wiik (DESY director 1993-1999) had a vision of building a **superconducting  $e^+ e^-$  linear collider with an integrated Röntgen Laser** within the international **TESLA collaboration**
  - TESLA Collaboration was established in early 1990's to develop "high-gradient, low-cost" superconducting accelerating cavities
  - DESY provided a site for Test Facilities (TTF, TTF Linac, TTF FEL, VUV-FEL@TTF2)

## TESLA Collaboration

Almost all laboratories worldwide using superconducting accelerating cavities participated (53 partners from 12 countries)

| Cost  |           |   |          |
|-------|-----------|---|----------|
| Goal: | 5 MV/m    | → | 25 MV/m  |
|       | 200 k\$/m | → | 50 k\$/m |
|       | ↓         |   | ↓        |
|       | 40 k\$/MV |   | 2 k\$/MV |

## TESLA Test Facility (TTF) in Hall 3 at DESY

## VUV-FEL @ TTF2

# TTF FEL: the first SASE FEL worldwide in VUV range

TTF Linac was about 100 m long, with maximum energy of 250 MeV, and located in Hall 3 at DESY

- **TTF Linac:** beam tests of the superconducting 1.3 GHz **TESLA accelerator modules** (1996 – 2002) and a driver of the **TTF FEL** Free-Electron Laser (1999 – 2002)
- TTF Linac and TTF FEL were installed step-by-step
  - First electron source (1996-1998) was a thermionic gun and subharmonic buncher, replaced by a **photo-injector** (RF-gun, Cs<sub>2</sub>Te cathode, Laser) in late 1998
  - **Booster** (“capture”) **cavity** installed in 1996, **first accelerator module** (ACC1) in spring 1997
  - ACC1 exchanged, **ACC2** and **bunch compressor** installed in 1998
  - Fixed-gap **undulator** installed in summer 1999

*TESLA cavity = 9-cell superconducting Niobium cavity  
Booster cavity = one TESLA Cavity in a cryostat,  
Accelerator Module = 8 TESLA Cavities in a cryostat*

# First Lasing at TTF FEL

22-Feb-2000 at 04:47: the first SASE lasing in VUV worldwide

The success of TTF FEL encouraged the funding and construction the first hard X-ray FELs e.g. LCLS and European XFEL

VOLUME 85, NUMBER 18 PHYSICAL REV

TABLE I. Main parameters of the TESLA Test Facility for FEL experiments (TTF FEL, phase 1).

| Parameter                                  | Measured value      |
|--------------------------------------------|---------------------|
| Beam energy                                | 233 ± 5 MeV         |
| rms energy spread                          | 0.3 ± 0.2 MeV       |
| rms transverse beam size                   | 100 ± 30 μm         |
| Normalized emittance, $\epsilon_n$         | 6 ± 3π mrad mm      |
| Electron bunch charge                      | 1 nC                |
| Peak electron current                      | 400 ± 200 A         |
| Bunch spacing                              | 1 μs                |
| Repetition rate                            | 1 Hz                |
| Undulator period, $\lambda_u$              | 27.3 mm             |
| Undulator peak field                       | 0.46 T              |
| Effective undulator length                 | 13.5 m              |
| Avg. betatron function horizontal/vertical | 1.2 m/1.1 m         |
| Radiation wavelength, $\lambda_{ph}$       | 109 nm              |
| FEL gain                                   | 3 × 10 <sup>3</sup> |
| FEL radiation pulse length                 | 0.4–1 ps            |

Photon wavelength at TTF FEL  
80 nm – 120 nm

Intense radiation from lasers has opened up many new areas of research in physics and chemistry, and has revolutionized optical technology. So far, most work in the field of nonlinear processes has been restricted to infrared, visible and ultraviolet light<sup>1</sup>, although progress in the development of X-ray lasers has been made recently<sup>2</sup>. With the advent of a free-electron laser in the soft-X-ray regime below 100 nm wavelength<sup>3</sup>, a new light source is now available for experiments with intense, short-wavelength radiation that could be used to obtain deeper insights into the structure of matter. Other free-electron sources with even shorter wavelengths are planned for the future. Here we present initial results from a study of the interaction of soft X-ray radiation, generated by a free-electron laser, with Xe atoms and clusters. We find that, whereas Xe atoms become only singly ionized by the absorption of single photons, absorption in clusters is strongly enhanced. On average, each atom in large clusters absorbs up to 400 eV, corresponding to 30 photons. We suggest that the clusters are heated up and electrons are emitted after acquiring sufficient energy. The clusters finally disintegrate completely by Coulomb explosion.

# VUV-FEL User Facility was part of the project since day one

SASE VUV-FEL (6 nm) @ TTF2 (1 GeV)

- Civil construction of a **new tunnel building** and an **experimental hall** started in 1999
  - as a part of the EXPO 2000 World Exhibition in Hannover (Germany)
  - June – October 2000: Science Exhibition “**Light for the New Millennium**” at DESY
- Installation and commissioning of electron and photon beamlines in 2003 - 2005

# VUV-FEL@TTF2 starts operation

Electron beam operation started in 2004 with 445 MeV beam energy

- Total length ~ 300 m
  - **Photo-injector**, **five TESLA type superconducting accelerator modules**, **two bunch compressors** (C-type and S-type), **transverse deflecting structure (TDS)**, **six fixed-gap undulators**, **photon diagnostics**, **experimental hall** (photon beamlines), **vertical bypass** line (to transport electron beam to dump w/o traversing undulators)
- **First lasing in January 2005 (32 nm)**

# FEL User Facility FLASH is born

First round of user experiments from June 2005 to March 2007

- Autumn 2005: user experiments at 32 nm and 45 nm
- April 2006: **Renaming VUV-FEL @ TTF2 to “FLASH”**
  - A wish from user experiments, starting to publish their first results, to have a more exiting name for the facility
- 2006: Energy increased to **700 MeV**  
→ **First lasing with the shortest wavelength: 13.1 nm** (April 2006)
- Spring 2006 – spring 2007: user experiments at wavelengths of **13.5 nm – 32 nm**

First lasing 13.1 nm 26-April-2006

We report results on the performance of a free-electron laser operating at a wavelength of 13.7 nm where unprecedented peak and average powers for a coherent extreme-ultraviolet radiation source have been measured. In the saturation regime, the peak energy approached 170  $\mu$ J for individual pulses, and the average energy per pulse reached 70  $\mu$ J. The pulse duration was in the region of 10 fs, and peak powers of 10 GW were achieved. At a pulse repetition frequency of 700 pulses per second, the average extreme-ultraviolet power reached 20 mW. The output beam also contained a significant contribution from odd harmonics of approximately 0.6% and 0.03% for the 3rd (4.6 nm) and the 5th (2.75 nm) harmonics, respectively. At 2.75 nm the 5th harmonic of the radiation reaches deep into the water window, a wavelength range that is crucially important for the investigation of biological samples.

Water window reached with the 5<sup>th</sup> harmonic

"Water window" = the range of X-ray wavelengths (~2.3–4.4 nm) where water is relatively transparent but carbon-based organic compounds strongly absorb

The average energy in the FEL pulse is 40  $\mu$ J.

# Original project goals reached

Beam energy up to 1 GeV, wavelength down to 6.5 nm, lasing with long bunch trains

- Energy upgrade in 2007
  - **ACC3** replaced by a new module
  - **Additional module ACC6** installed
- **1 GeV** energy reached in September 2007, lasing at **6.5 nm** in early October 2007
- Installation of an electromagnetic **THz Undulator**
  - Primary purpose was longitudinal electron bunch diagnostics, but its potential to produce **THz radiation for experiments** was soon recognized

# Next upgrade enables lasing (fundamental) in water window

3<sup>rd</sup> harmonic module linearizes the longitudinal phase space distribution: more regular longitudinal bunch shape

- Shutdown September 2009 to March 2010
  - Installation of an **additional module ACC7** (PXFEL1) → **1.25 GeV** → **4.1 nm**
  - Exchange of module ACC1 and installation of **3.9 GHz** (3<sup>rd</sup> harmonic) **module ACC39** (from Fermilab)
  - Installation of **sFLASH** seeding experiment
- Change to **10 Hz** operation (bunch train repetition rate)

# Experiments across different fields of science

Harvesting phase 2007 - 2013

## Resonant magnetic scattering with fs-pulses at 1.59 nm

C. Gutt et al.  
2007

# FLASH2: the second soft x-ray SASE undulator line

driven by FLASH linac, variable gap-undulators in a distinct building, and an own experimental hall

- The success of FLASH encouraged to construct a **second soft x-ray SASE undulator line**
- Civil construction started in 2011; connected to FLASH linac in 2013
- Simultaneous operation of two undulator beamlines, both at 10 Hz bunch train repetition rate
  - Fast kicker** and **Lambertson septum** extracts a part of the bunch train to FLASH2
  - Bunch/pulse parameters** (number, spacing, charge, duration) for FLASH1 and FLASH2 can be tailored nearly **independently**, thanks to sophisticated and flexible Injector laser(s) and LLRF system

FLASH1 = "old" SASE beamline with fixed-gap undulators  
 FLASH2 = "new" SASE beamline with variable-gap undulators  
 FLASH3 = electron beamline in the same building as FLASH2 for Accelerator R&D

# Two SASE undulator lines simultaneously in user operation

Harvesting phase 2016 – 2021 (last years hampered with the COVID-19 pandemic)

## Parameters FLASH1 / FLASH2

|                          |                          |
|--------------------------|--------------------------|
| Wavelength (fundamental) | 4.2 – 51 nm / 4 – 90 nm  |

# FLASH2020+ upgrade project

Energy upgrade, high repetition rate seeding, variable polarization

2018-2026

Realization included **two long installation shutdowns**: 2021/22 (9 months), 2024/2025 (14 months)

## Stage 1

**Energy upgrade** → exchange ACC2 & ACC3  
New injector lasers      Laser heater  
New movable BC2      BC at FLASH2  
TDS at FLASH2      Afterburner FLASH2

## Stage 2 (FLASH1)

Infrastructure upgrade  
High repetition rate **seeding**  
Photon diagnostics  
Pump-probe laser FLASH1

**Superconducting 1.35 GeV Linac**  
with seven TESLA type modules

The new **ACC2** (PXM2.1) and **ACC3** (PXM3.1) are the **best TESLA type modules** in beam operation worldwide

Variable polarization:  
**APPLE-III undulators**

- FLASH1 radiator  
3 planar + 6 APPLE-III
- FLASH2 afterburner  
1 APPLE-III

HGHG = High-Gain Harmonic Generation  
EEHG = Echo-Enabled Harmonic Generation

# FLASH is an unique FEL

operating in parallel externally seeded FEL and SASE FEL with a high repetition rate

**5000 photon pulses / second**  
shared between FLASH1 and FLASH2  
500 bunches with 1 MHz spacing per train,  
train repetition rate 10 Hz

## FLASH1: Externally seeded FEL

- HGHG and EEHG seedings
- Narrow spectral bandwidth
- Shot to shot stability
- Full coherence

## FLASH2: SASE FEL

- High pulse energy
- Shortest pulses
- Transverse coherence

## FLASH3: PWFA

- FLASHForward  
plasma wakefield  
acceleration experiment

# FLASH is the forerunner of FEL user facilities worldwide

FLASH is continuously upgraded to define the state of the art in soft X-ray FEL technology

**TTF Linac**  
demonstrated the feasibility  
of high gradient  
**superconducting**  
accelerator technology

**TTF-FEL**  
was the **first**  
**SASE FEL**  
in VUV range

**FLASH**  
was the **first** XUV-FEL user facility

**FLASH1 + FLASH2**  
was the **first** facility operating **two**  
undulator beamlines in parallel

**FLASH**  
is **unique** with  
**1 MHz seeding** and  
parallel operation of  
seeded and **SASE** beamlines

1995

2000

2005

2010

2015

2020

2025

Beam energy up to **250 MeV**  
Photon wavelength: **80 nm** – 120 nm

Beam energy up to **700 MeV**  
Photon wavelength down to **13 nm**

2007

Energy upgrade to **1 GeV**  
Photon wavelength down to **6.5 nm**

2009/10

Energy upgrade to **1.25 GeV**  
Photon wavelength down to **4.1 nm**

2022

Energy upgrade to **1.35 GeV**  
**FLASH2** photon wavelength down to **3.2 nm**

2024/25/26

**FLASH1: HGHG and EEHG in parallel with FLASH2 SASE**  
**FLASH2: photon wavelength down to ~ 1.5 nm with 3rd harmonic afterburner**  
**Variable polarization**

Many of the key technologies for  
high performance FELs have been and are  
invented at TTF FEL and FLASH

# The key to success lies in a passionate and dedicated team

Thanks to everyone who has contributed to TTF/FLASH over the past 30 years!

It is a team work!

\* with afterburner

# FEL principle

Ingredients:

Relativistic e-beam

Undulator

Up to here, we have “just” synchrotron radiation

We have to “convince” the electrons to radiate in phase, by adding a small ingredient:

Electro-magnetic wave

Amplification through energy transfer between e-beam and light

# What is SASE?

## Self-amplified spontaneous emission principle

1. The electron beam propagates in a long undulator and emits synchrotron radiation and starts interacting with the spontaneous emission
2. The spontaneous emission is, eventually, amplified
3. up to saturation (or to the undulator end)

[www-ssrl.slac.stanford.edu/lcls/glossary.html](http://www-ssrl.slac.stanford.edu/lcls/glossary.html)

# What is seeding?

- Single-pass FELs can amplify the **noise** present in the electron beam density profile obtaining powerful SASE radiation.
- Using instead an “**external**” electromagnetic field (a seed) it is possible to initiate the FEL process in a deterministic way.
- The **properties** of the output FEL radiation are **inherited** and **determined** by the seed itself.

Compared to SASE devices, seeding can be **more compact** and produces **nearly fully temporally coherent** output.

Spectral parameters can be controlled.

# High Gain Harmonic Generation

HGHG

## Modulator

## Dispersive section

## Radiator

# Echo Enabled Harmonic Generation

## EEHG

G. Stupakov, PRL, 2009

D. Xiang, G. Stupakov, PRST-AB, 2009

- The first laser generates an energy modulation in electron beam.
- A strong chicane creates stripes in the longitudinal phase space.
- The second laser imprints an energy modulation.
- The second chicane converts the energy modulation into harmonic density modulation.

# Wavelengths for FLASH1

60 nm to 4 nm by using 5<sup>th</sup> to 75<sup>th</sup> harmonic of seed laser

**Seed 1:** 343 nm, 100 MW, 500 fs

**Seed 2:** 297-317 nm, 300 MW, 50 fs
