## **Application of a modified feedforward control algorithm for superconducting cavity**

*Monday, 8 May 2023 16:30 (2 hours)*

Iterative learning control(ILC) is a effective algorithm for transient beam loading compensation. However, considering the algorithm complexity and the hardware cost, the ILC algorithm is usually implemented outside FPGA. This practice would decrease the real-time ability of the control system. In this paper, a real-time ILC algorithm will be introduced. And the result is summarized.
