Analytic calculations of RDT and detuning generated by beam-beam collisions and wire correctors

Wednesday, 10 May 2023 16:30 (2 hours)

Formulae to compute the footprint (amplitude-dependent detunings) and Resonance driving terms RDT, generated by long-range beam-beam collisions and wire correctors have been implemented in a Python code. The paper briefly outlines the method and code and provides several examples of its usage. The maximum extent of the footprint (in geometric sense) can be efficiently computed.
