## **Radio-Frequency-Detuning Based Modeling and Simulation of Electron Bunch Train Quality**

*Tuesday, 23 August 2022 17:40 (20 minutes)*

A numerical study is carried out on the quality of the electron bunch train produced from a photoinjector based on a frequency-detuning dependent gun coupler kick. The impact of the kick on the emittance of the bunch train is modelled via three-dimensional electromagnetic field maps calculated at detuned frequencies of the gun cavity within long radio-frequency pulses. Beam dynamics simulations are performed in the so-called frequency-detuning regime. Preliminary results are presented and discussed.
