## Injection of collider-quality e-beams in plasma accelerators

*Monday, 20 May 2024 16:00 (2 hours)*

The plasma accelerator community has made significant progress in advancing particle beams, bringing us closer to realizing the dream of replacing the radio frequency (RF) cavities' MV/m fields with the plasma-sustained GV/m fields for collider applications. The beam requirements for realizing this vision emphasize a collider-quality beam featuring hundreds of pC of charge, energy spread less than 1%, and a normalized emittance in the tens of nanometers range. Achieving the low-energy-spread of the beam during acceleration involves flattening the accelerating field within the wakefield region occupied by the beam, which can be accomplished if the charge per unit length of the injected electron beam to exhibit a trapezoidal profile. In this study, we demonstrate how novel techniques for controlling the spatiotemporal properties of a focusing laser pulse enable the optical injection of an electron bunch inside a plasma wakefield that meets all the beam requirements for collider applications. Quasi-3D particle-in-cell simulations demonstrate the feasibility of this method for producing beams exceeding 200 pC of charge with emittance and energy spread well within collider requirements.

### Footnotes

### Funding Agency

U.S. Department of Energy, Office of Science under Award No. DE-SC-0014043, DE-SC-0020396, resources of NERSC facility under Contract No. DE-AC02-5CH11231, and SEAWULF at Stony Brook University.

### Paper preparation format

LaTeX

### Region represented

North America

**Primary author:** JAIN, Arohi (Stony Brook University)

**Co-authors:** PIERCE, Jacob (University of California, Los Angeles); YAN, Jiayang (Stony Brook University); PALASTRO, John (University of Rochester); VAF AEI-NAJAFABADI, Navid (Stony Brook University); SIMPSON, Tanner (University of Rochester); MORI, Warren (University of California, Los Angeles)

**Presenter:** VAF AEI-NAJAFABADI, Navid (Stony Brook University)

**Session Classification:** Monday Poster Session

**Track Classification:** MC3: Novel Particle Sources and Acceleration Techniques: MC3.A22 Plasma Wakefield Acceleration
