Proposal for a proton-bunch compression experiment at IOTA in the strong space-charge regime

Monday, 20 May 2024 16:00 (2 hours)

The longitudinal compression of intense proton bunches with strong space-charge force is an essential component of a proton-based muon source for a muon collider. This paper discusses a proton-bunch compression experiment at the Integrable Optics Test Accelerator (IOTA) storage ring at Fermilab to explore optimal radio frequency (RF) cavity and lattice configurations. IOTA is a compact fixed-energy storage ring that can circulate a 2.5-MeV proton beam with varying beam parameters and lattice configurations. The study will aim to demonstrate a bunch-compression factor of 2 to 10 in the IOTA ring while examining the impact of intense space-charge effects on the compression process.
