Radiographic source prediction for linear induction accelerators using machine learning

Tuesday, 21 May 2024 16:00 (2 hours)

The penetrating radiography provided by the Dual Axis Radiographic Hydrodynamic Test (DARHT) facility is a key capability in executing a core mission of the Los Alamos National Laboratory (LANL). Historical data from the two DARHT Linear Induction Accelerators (LIAs), built as hdf5 data structures for over a decade of operations, are being used to train machine learning models to assist in beam tuning. Adaptive machine learning (AML) techniques that incorporate physics-based models are being designed to use noninvasive diagnostic measurements to address the challenge of predicting the radiographic spot size, which depends on the time variation in accelerator performance and the density evolution of the conversion target. Pinhole collimator images recorded by a gamma ray camera (GRC) provide a direct measurement of the radiograph imaging quality but are not always available. A framework is being developed to feed results of these invasive measurements back into the accelerator models to provide virtual diagnostic measurements when these measurements are not available.

Footnotes

Funding Agency

Research presented in this conference paper was supported by the Laboratory Directed Research and Development program of Los Alamos National Laboratory under project numbers XXG2 and XXB6.

Paper preparation format

LaTeX

Region represented

North America

Primary author: KOGLIN, Jason (Los Alamos National Laboratory)

Co-authors: MCKERNS, Micheal (Los Alamos National Laboratory); SCHEINKER, Alexander (Los Alamos National Laboratory); SCHWARTZ, Broderick (Los Alamos National Laboratory); WAKEFORD, Daniel (Los Alamos National Laboratory)

Presenter: KOGLIN, Jason (Los Alamos National Laboratory)

Session Classification: Tuesday Poster Session

Track Classification: MC6: Beam Instrumentation, Controls, Feedback, and Operational Aspects: MC6.D13 Machine Learning
