

# Advancements in Nb<sub>3</sub>Sn growth for SRF technology

*Monday 26 August 2024 16:00 (2 hours)*

Nb<sub>3</sub>Sn is the most promising alternative material for the future of superconducting radio-frequency (SRF) technology, steadily advancing towards practical applications. Having a critical temperature twice that of niobium, Nb<sub>3</sub>Sn offers the potential for developing smaller, more powerful, and more efficient accelerators. We have designed a comprehensive study to synthesize and characterize substrate treatments at nucleation temperatures following the thermal vapor diffusion growth process to improve the uniformity of Nb<sub>3</sub>Sn coatings, pushing its performance closer to fundamental limits.

## Footnotes

## Funding Agency

Work supported by the National Science Foundation under Grant No. PHY-1549132, the Center for Bright Beams and U.S. DOE grant No. DE-SC0008431.

**Primary author:** SHPANI, Liana (Cornell University (CLASSE))

**Co-authors:** WANG, Chi (National Cheng Kung University); LEW-KIEDROWSKA, Helena (The University of Chicago); LIEPE, Matthias (Cornell University (CLASSE)); SIBENER, Steven (The University of Chicago); DO, Van (The University of Chicago)

**Presenter:** SHPANI, Liana (Cornell University (CLASSE))

**Session Classification:** Monday Poster Session

**Track Classification:** MC4: Technology: MC4.8 Superconducting RF
