

Decoupling of nitrogen and oxygen impurities in doped SRF cavities

Thursday 29 August 2024 16:00 (2 hours)

The performance of superconducting radiofrequency (SRF) cavities is critical to enabling the next generation of efficient high-energy particle accelerators. Recent developments have focused on altering the surface impurity profile through in-situ baking, furnace baking, and doping to introduce and diffuse beneficial impurities such as nitrogen, oxygen, and carbon. However, the precise role and properties of each impurity are not well understood. In this work, we attempt to disentangle the role of nitrogen and oxygen impurities through time-of-flight secondary ion mass spectrometry of niobium samples baked at temperatures varying from 75-800 C with and without nitrogen injection. From these results, we developed treatments recipe that decouple the effects of oxygen and nitrogen in doping treatments. Understanding how these impurities and their underlying mechanisms drive further optimization in the tailoring of impurity profiles for high-performance SRF cavities.

Footnotes

Funding Agency

Work supported by the Fermi National Accelerator Laboratory, managed and operated by Fermi Research Alliance, LLC under Contract No. DE-AC02-07CH11359 with the U.S. Department of Energy.

Author: HU, Hannah (University of Chicago)

Co-authors: BAFIA, Daniel (Fermi National Accelerator Laboratory); KIM, Young-Kee (University of Chicago)

Presenter: HU, Hannah (University of Chicago)

Session Classification: Thursday Poster Session

Track Classification: MC4: Technology: MC4.8 Superconducting RF
