Understanding superconducting cavities with the least action principle

Wednesday 4 June 2025 16:00 (2 hours)

The least action principle is applied to better understand superconducting cavities. This principle, which is fundamental to forces such as electromagnetic forces, is used to derive the equations of motion. By applying the least action principle, heat dissipation in superconducting cavities is analyzed. When RF power is applied to a superconducting cavity, heat dissipation occurs within the cavity. Quantum effects in superconducting cavities are also explored, with particular attention to the quantization of the quality factor.
